Here, customised 3D models can be created using built-in elements to design and reproduce acoustics for a wide range of live audio installation.n- LEAP allows audio engineers to develop and publish new versions of sound designs and modules for the LEAP V5 and the LEAP Analyser. More Version 5.1 of Enclosure Shop delivers major new functionality for audio producers, and is the first to offer the possibility to extract three-dimensional information from 3D sound design and graphic models. Its most obvious and the most challenging feature is the ability to select only the sounds and material surfaces within a custom 3D design for parameter extraction. The other big and perhaps less obvious addition is that it is now possible to export 3D models directly to your email, providing you with a means of storing and exchanging design models over the internet. The inclusion of a new hierarchical display mode also enhances the user experience, making Enclosure Shop easier to navigate and work with. The biggest change of all is the interface has been completely rebuilt and now uses a modern material look, with a cleaner and more intuitive layout and workflow. The second software application, LEAP Analyser V5, is a virtual version of the LEAP Analyser instrument that allows you to record and analyse any type of signal and convert it into a set of frequency characteristics, and visualise and display these in a number of ways. Version 5.2 has been optimised for a faster workflow and easier programming. It adds a few new functions, including: . Record, load and analyse sound signals and waveforms. . Repeat the last recording, to allow for multiple recordings at the same time. . Insert two copies of an audio track into the audio analysis window, or even into the console window, where each has its own user interface. . Ability to create any number of signal paths for the user's analysis. . Ability to create and load a sound track that will be heard by the user when he or she plays the model. . Ability to determine the exact position of the analyser in the 3D model using the navigation mesh. . Ability to change the analyser position by using the navigation mesh. . The possibility to automate tasks when recording, loading, or analysing, so that they can be repeated in a loop. The second major new feature is a parameter-based sound library. With this sound library, you 82157476af
